**INSTRUCTIONS**

1. Only accurately labeled samples will be accepted. (Patient name, hospital number, date, initials of person collecting specimen).
2. A freshly drawn sample is required every 3 days for crossmatching red blood cell transfusions.
3. Keep original for the patient's chart and send remainder of form to Transfusion Service with blood specimen.
4. INFORMED CONSENT IS REQUIRED.

REQUEST FOR BLOOD COMPONENTS

EMERGENCY RELEASE: In consideration of the critical condition of this patient, I request the immediate release of blood/blood components for transfusion without compatibility testing.

 REQUISITION NO: 01253928
 MED RECORDS (CHART) COPY

N/S: GSUR AM/BD: J602 OR VISIT CLINIC:
 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CT CHEST W/CM

CHEST CT, 01/15/99:

REASON FOR STUDY: Evaluate right pleural fluid collection.

IMPRESSION:

1. Improvement in the right hydropneumothorax with a small amount of loculated fluid and air seen laterally.
2. Probable loculated fluid and air in the major fissure with a necrotic parenchymal pneumonia thought less likely.
- Improved aeration in both lung bases with minimal subsegmental atelectasis persisting..
4. Improved right upper lobe pneumonia.
5. Query right hepatic lobe pseudoaneurysm versus venous fistula as discussed.

THORACIC CT.

TECHNIQUE: Seven (7) mm thick transaxial enhanced helical CT images were obtained from the lung apices down to the diaphragm utilizing a pitch of 1:1. Comparison is made to an earlier study dated 12/12/98.

FINDINGS: Since earlier the same day, the right pleural fluid has decreased. There is, however, a small lateral component with several foci of air within this and this is thought to be loculated. The right thoracotomy tube remains in place. A fluid and air collection is seen in the right midlung and this appears to conform to the location of the major fissure and likely represents loculated fluid and this also contains several foci of air collections. There is improved aeration in the lung bases bilaterally with minimal subsegmental atelectasis persisting. Ill-defined opacity in the right lung apex has decreased in size and is compatible with resolving inflammation/infection. A small bore pigtail catheter is now located in the previously noted heterogeneous right hepatic lobe mass. There now, however, appears to be a central area of enhancement within this defect

N/S: GSUR RM/BD: J602 OR VISIT CLINIC:
 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CHEST 2 VWS, PA & LAT

PA AND LATERAL CHEST RADIOGRAPHS, 01/12/99:

CLINICAL HISTORY: Generalized abdominal pain, placement of a chest tube.

IMPRESSION:

1. There is new placement of a right-sided lateral chest tube, which extends into an area that contains a loculated pneumothorax.
2. Large right pleural effusion.

COMMENT: PA and lateral chest radiographs are submitted dated 01/12/99

There has been interval removal of nasogastric and left subclavian lines. There has been interval placement of a right-sided chest drain into the lateral aspect of the right pleural compartment. It is within a space that contains a pneumothorax which is loculated. Other portions of the right lung show a pleural effusion, but it is uncertain if this is also loculated. Decubitus films may be of assistance in better defining the possibility of further loculations.

There are two other drains, one of which overlies the superior portions of the right liver. The exit site is anterior. The left and third drain on this film appears to be subphrenic, and exits laterally.

The visualized portions of the left lung show a metallic fragment, most likely a bullet, overlying the medial aspects of the left clavicle. The left lung is otherwise clear. The cardiovascular silhouette is difficult to assess on the right side, but the left side shows a heart size that is upper limits of normal. This report was dictated by a Radiology resident/fellow. The images and the contents of the report were personally reviewed by an attending physician.

N/S: GSUR RM/BD: J602 OR VISIT CLINIC:
 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CT ABDOMEN W/O CM

CHEST CT, 01-11-99:

INDICATION: Evaluate chest tube placement. Patient is a 24-year-old Black male status post gunshot wound with chest tube placed for drainage as well as intrahepatic catheter to drain a fluid collection in the liver.

IMPRESSION:

1. Successful placement of a liver drainage catheter.
2. Misplaced chest tube catheter. The catheter is within the subcutaneous tissue.
3. No change in the position of the subdiaphragmatic catheter.

TECHNIQUE: Axial CT images of the chest were obtained at 10 mm intervals. The images were then displayed in soft tissue windows and in lung windows.

FINDINGS: The study shows that the patient has a large collection of fluid within the liver. There is contrast within this fluid collection. In addition, the drainage catheter is seen entering the patient's right mid axillary line entering into this liver collection. The patient also has a drainage catheter entering near the patient's midline. This catheter appears to be within the subdiaphragmatic space. The patient had a posterior right loculated fluid collection on CT scan dated 01-10-99. This collection is no longer evident. However, the chest tube drainage catheter is seen to be coiled in the soft tissue. The patient has basilar atelectasis as well as fluid collection still in the subhepatic region. In addition, the patient has mild to moderate fluid with a combination of pleural thickening along the right lateral chest wall.

This report was dictated by a Radiology Resident/Fellow. The images and the contents of the report were personally reviewed by an Attending Physician.

 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CT GUIDE/CYST ASPIRAT CHEST

CT-GUIDED CHEST TUBE DRAINAGE PLACEMENT, 01-11-99:

INDICATION: Patient is a 24-year-old Black male status post gunshot wound who had a chest tube placed within the right pleural space which no longer is in its proper position.

PHYSICIANS: Dr. Pong and Dr. Cohen. Dr. Cohen was present throughout the procedure.

PROCEDURE: After obtaining informed consent, the patient was laid supine on the CT table. An area was chosen along the patient's right mid clavicular line for percutaneous access. This area was then sterilized and draped. Under CT guidance, a needle was placed into the right pleural fluid collection. Through this access site, a wire was placed through the hub of the needle. This was exchanged for an 8-French dilator and eventually an 8-French drainage catheter was placed in the pleural fluid collection. CT images show proper placement of the catheter. There were no complications from the procedure. The patient left the Angiography Suite in good condition.

COMPLICATIONS: None.

MEDICATION: The patient received Versed and Fentanyl for conscious sedation.

This report was dictated by a Radiology Resident/Fellow. The images and the contents of the report were personally reviewed by an Attending Physician.

 DOB: 05/14/1974 AGE: 24 SEX: M
 MR#: 96925490 9010 STATUS: IA

ORD'D BY: DUKE, JAMES H. (TRAUMA)
 DT PERF: 01/11/99 AT 10:45 HRS.
 REQUISITION NO: 01252024
 MED RECORDS (CHART) COPY

N/S: GSUR RM/BD: J602 OR VISIT CLINIC:
 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CHEST TUBE INSERTION-FLUORO

CHEST TUBE DRAINAGE AS WELL AS LIVER ABSCESS DRAINAGE, 01-11-99:
 INDICATION: Patient is a 24-year-old Black male status post
 gunshot wound. The patient developed a right pleural effusion
 which appears to be infected. In addition, the patient had a fluid
 collection within the liver which had a drain which was removed
 inadvertently.

IMPRESSION:

Placement of an 8-French right chest tube.
 Successful placement of an 8-French drainage catheter into the
 liver collection.

PHYSICIANS: Pong and Cohen. Dr. Cohen was present throughout the
 procedure.

PROCEDURE: After obtaining informed consent, the patient was laid
 on his left side. An area along the patient's back side was chosen
 just to the right of the spine. This place was chosen for
 percutaneous access using ultrasound guidance. The area was then
 sterilized and draped. 1% lidocaine solution was used for local
 anesthetic. Under ultrasound guidance, an 18-gauge needle was
 inserted into the right pleural fluid collection. Purulent
 material was obtained. A J-wire was placed into the collection.
 This was exchanged for an 8-French dilator. Using Seldinger
 technique, this was eventually exchanged for an 8-French drainage
 catheter. The tube was connected to external drainage and suction.
 About 60 cc of serosanguinous as well as purulent material was
 obtained.

An area over the patient's right mid axillary line was chosen for
 percutaneous access for the liver collection drainage. This area
 was sterilized and draped. 1% lidocaine solution was used for
 local anesthetic. A small skin incision was made. Under
 ultrasound guidance, an 18-gauge needle was placed into the right
 hepatic fluid collection. Old blood was aspirated from the

collection. A wire was advanced into the collection. Using Seldinger technique, this was eventually exchanged for an 8-French dilator and eventually an 8-French all-purpose drain catheter. Contrast instillation into the collection showed that it was in the proper position.

COMPLICATIONS: None.

MEDICATIONS: The patient received Versed and Fentanyl for conscious sedation.

FOLLOW-UP: The patient was sent for CT for follow-up to determine proper placement of the tube.

This report was dictated by a Radiology Resident/Fellow. The images & the contents of the report were personally reviewed by an Attending Physician.

N/S: GSUR RM/BD: J602 OR VISIT CLINIC:
 INDICATIONS: GENERALIZED ABD PAIN

EXAM(S) PERFORMED: CT ABDOMEN W/CM

ABDOMINAL CT, 01-10-99:
 CLINICAL HISTORY: Rule out abscess.

IMPRESSION:

1. Loculated right pleural fluid collection with an enhancing rim which is not being drained by the right chest tube.
2. Fluid collection in the right lobe of the liver with the drainage catheter which has decreased in size since the prior study.

. Bullet in the right flank.

TECHNIQUE: 7 mm cuts were obtained through the abdomen followed by 10 mm cuts through the pelvis with the use of oral and IV contrast.
 FINDINGS: Comparison is made to 12-26-98 study. The patient is status post gunshot wound with the bullet in the right flank. The right chest tube is present with a loculated pleural fluid collection just superior to the chest tube. The second drain is present in the right lobe of the liver with a fluid collection measuring approximately 10 cm AP x 5 cm transversely. This fluid collection has decreased in size and has become more confluent since the prior study. It has an enhancing rim. The remainder of the liver is unremarkable. The spleen, pancreas, both kidneys, and both adrenal glands are within normal limits. Scarring versus atelectasis are present in the right lower lobe.
 This report was dictated by a Radiology Resident/Fellow. The images and the contents of the report were personally reviewed by an Attending Physician.
